INDEX

s.no	Topic	Date	Signature
1.	To explore networking commands	01/08/22	
2.	To explore configure various network topologies.	01/08/22	
3.	To configure switch for different topologies.	08/08/22	
4.	To explore and configure VLANs.	29/08/22	
5.	To configure Router	12/09/22	
6.	Configuring router and learn about 802.11 protocol	19/09/22	
7.	To configure ipv6 address on a router	26/09/22	
8.	To learn static routing of the routers	03/10/22	
9.	To use DHCP, DNS & WEB service using servers	10/10/22	

Lab-1

Aim : To explore and learn networking commands.

Commands:
Name: ping

Usage:
A ping is a basic internet program that allows a user to test and verify if a particular destination IP address exists and can accept requests in computer network administration.

Syntax:

```
ping [options] <target address>
```

options:

-t   Ping the specified host until stopped.

          To see statistics and continue - type Control-Break;

          To stop - type Control-C.

  -a   Resolve addresses to hostnames.

  -n count   Number of echo requests to send.

  -l size   Send buffer size.

  -f   Set Don't Fragment flag in packet (IPv4-only).

  -i TTL   Time To Live.

  -v TOS   Type Of Service (IPv4-only. This setting has been deprecated

          and has no effect on the type of service field in the IP

          Header).

  -r count   Record route for count hops (IPv4-only).

  -s count   Timestamp for count hops (IPv4-only).

  -j host-list Loose source route along host-list (IPv4-only).

  -k host-list Strict source route along host-list (IPv4-only).

  -w timeout   Timeout in milliseconds to wait for each reply.

  -R   Use routing header to test reverse route also (IPv6-only).

          Per RFC 5095 the use of this routing header has been

          deprecated. Some systems may drop echo requests if

          this header is used.

  -S <Srcaddr> Source address to use.

-c   compartment Routing compartment identifier.

-p   Ping a Hyper-V Network Virtualization provider address.

-4   Force using IPv4.

-6   Force using IPv6.

Example:

```
C:\Users\DELL>ping 202.12.103.20

Pinging 202.12.103.20 with 32 bytes of data:
Reply from 202.12.103.20: bytes=32 time=5ms TTL=251
Reply from 202.12.103.20: bytes=32 time=37ms TTL=251
Reply from 202.12.103.20: bytes=32 time=1ms TTL=251
Reply from 202.12.103.20: bytes=32 time=11ms TTL=251

Ping statistics for 202.12.103.20:
    Packets: Sent = 4, Received = 4, Lost = 0 (0% loss),
Approximate round trip times in milli-seconds:
    Minimum = 1ms, Maximum = 37ms, Average = 13ms
```

```
C:\Users\DELL>ping 202.12.103.20 -t

Pinging 202.12.103.20 with 32 bytes of data:
Reply from 202.12.103.20: bytes=32 time=38ms TTL=251
Reply from 202.12.103.20: bytes=32 time=1ms TTL=251
Reply from 202.12.103.20: bytes=32 time=2ms TTL=251
Reply from 202.12.103.20: bytes=32 time=40ms TTL=251
Reply from 202.12.103.20: bytes=32 time=1ms TTL=251
Reply from 202.12.103.20: bytes=32 time=8ms TTL=251
Reply from 202.12.103.20: bytes=32 time=43ms TTL=251
Reply from 202.12.103.20: bytes=32 time=1ms TTL=251
Reply from 202.12.103.20: bytes=32 time=10ms TTL=251
Reply from 202.12.103.20: bytes=32 time=46ms TTL=251
Reply from 202.12.103.20: bytes=32 time=1ms TTL=251
Reply from 202.12.103.20: bytes=32 time=16ms TTL=251
Reply from 202.12.103.20: bytes=32 time=49ms TTL=251
Reply from 202.12.103.20: bytes=32 time=1ms TTL=251
Reply from 202.12.103.20: bytes=32 time=16ms TTL=251
Reply from 202.12.103.20: bytes=32 time=1ms TTL=251
Reply from 202.12.103.20: bytes=32 time=1ms TTL=251
Reply from 202.12.103.20: bytes=32 time=12ms TTL=251
Reply from 202.12.103.20: bytes=32 time=1ms TTL=251
Reply from 202.12.103.20: bytes=32 time=1ms TTL=251
Reply from 202.12.103.20: bytes=32 time=14ms TTL=251

Ping statistics for 202.12.103.20:
    Packets: Sent = 21, Received = 21, Lost = 0 (0% loss),
Approximate round trip times in milli-seconds:
    Minimum = 1ms, Maximum = 49ms, Average = 14ms
Control-C
^C
```

```
C:\Users\DELL>ping 202.12.103.20 -n count
Bad value for option -n, valid range is from 1 to 4294967295.
```

Name: ipconfig

Usage:

The ipconfig command displays all the currently connected network interfaces whether they are active or not.

Syntax:

```
ipconfig [options]
```

options:

```
  /all            Display full configuration information.

      /release        Release the IPv4 address for the specified
adapter.

      /release6       Release the IPv6 address for the specified
adapter.

      /renew          Renew the IPv4 address for the specified adapter.

      /renew6         Renew the IPv6 address for the specified adapter.

      /flushdns       Purges the DNS Resolver cache.

    /registerdns    Refreshes all DHCP leases and re-registers DNS names

      /displaydns      Display the contents of the DNS Resolver Cache.

    /showclassid    Displays all the dhcp class IDs allowed for adapter.

      /setclassid     Modifies the dhcp class id.

      /showclassid6   Displays all the IPv6 DHCP class IDs allowed for
adapter.

      /setclassid6    Modifies the IPv6 DHCP class id.
```

Example:

Name: `tracert`

`Usage:`

The tracert diagnostic utility determines the route to a destination by sending internet control message protocol(ICMP) echo packets to the destination.

Syntax:

`tracert [options] <target address>`

Options:

   -d   Do not resolve addresses to hostnames.

   -h maximum_hops   Maximum number of hops to search for target.

   -j host-list   Loose source route along host-list (IPv4-only).

   -w timeout   Wait timeout milliseconds for each reply.

   -R   Trace round-trip path (IPv6-only).

   -S srcaddr   Source address to use (IPv6-only).

   -4   Force using IPv4.

   -6   Force using IPv6.

Example:

```
C:\Users\DELL>tracert 202.12.103.20

Tracing route to 202.12.103.20 over a maximum of 30 hops

  1     1 ms    <1 ms     1 ms  10.103.255.254
  2     8 ms    <1 ms     1 ms  10.0.253.1
  3     9 ms     1 ms     1 ms  202.12.103.126
  4     2 ms     3 ms     1 ms  202.12.103.14
  5     1 ms    <1 ms    <1 ms  202.12.103.20

Trace complete.
```

```
C:\Users\DELL>tracert google.com

Tracing route to google.com [142.250.194.14]
over a maximum of 30 hops:

  1     1 ms     1 ms     1 ms  10.103.255.254
  2     1 ms     1 ms    <1 ms  10.0.253.1
  3     1 ms     2 ms     1 ms  202.12.103.126
  4    21 ms     1 ms     1 ms  74.125.50.56
  5     5 ms     3 ms     3 ms  108.170.251.97
  6     2 ms     1 ms     1 ms  142.251.52.199
  7    21 ms     1 ms     1 ms  del12s01-in-f14.1e100.net [142.250.194.14]

Trace complete.
```

Name: arp

Usage:

The arp command displays and modifies the Internet-to-adapter address translation tables used by the Address in Networks and communication management.

Syntax:
```
pathping [options] <target name>
```

Options:

-a Displays current ARP entries by interrogating the current

   protocol data. If inet_addr is specified, the IP and Physical

   addresses for only the specified computer are displayed. If

   more than one network interface uses ARP, entries for each ARP

   table are displayed.

-g Same as -a.

-v Displays current ARP entries in verbose mode. All invalid

   entries and entries on the loop-back interface will be shown.

inet_addr Specifies an internet address.

-N if_addr Displays the ARP entries for the network interface specified

   by if_addr.

-d Deletes the host specified by inet_addr. inet_addr may be

   wildcarded with * to delete all hosts.

-s Adds the host and associates the Internet address inet_addr

   with the Physical address eth_addr. The Physical address is

   given as 6 hexadecimal bytes separated by hyphens. The entry

   is permanent.

eth_addr Specifies a physical address.

if_addr If present, this specifies the Internet address of the

   interface whose address translation table should be modified.

   If not present, the first applicable interface will be used.

Example:

```
Interface: 192.168.137.1 --- 0xb
  Internet Address      Physical Address      Type
  192.168.137.255       ff-ff-ff-ff-ff-ff     static
  224.0.0.22            01-00-5e-00-00-16     static
  224.0.0.251           01-00-5e-00-00-fb     static
  224.0.0.252           01-00-5e-00-00-fc     static
  239.192.152.143       01-00-5e-40-98-8f     static
  239.255.255.250       01-00-5e-7f-ff-fa     static
  255.255.255.255       ff-ff-ff-ff-ff-ff     static

Interface: 10.103.28.82 --- 0x10
  Internet Address      Physical Address      Type
  10.103.255.254        d8-24-bd-91-26-40     dynamic
  10.103.255.255        ff-ff-ff-ff-ff-ff     static
  224.0.0.22            01-00-5e-00-00-16     static
  224.0.0.251           01-00-5e-00-00-fb     static
  224.0.0.252           01-00-5e-00-00-fc     static
  224.0.0.253           01-00-5e-00-00-fd     static
  239.192.152.143       01-00-5e-40-98-8f     static
  239.255.255.250       01-00-5e-7f-ff-fa     static
  255.255.255.255       ff-ff-ff-ff-ff-ff     static
```

Name: pathping

Usage:

Provides information about network latency and network loss at intermediate hops between a source and destination.

Syntax:
```
pathping [options] <target name>
```

Options:

```
-g
```
Loose source rout along host-list.
```
-h <maximum_hops>
```
Maximum number of hops to search for target.
```
-i <address>
```
Use the specified source address.
```
-n
```
Do not resolve addresses to hostnames.
```
-p <period>
```
Wait period milliseconds between pings.
```
-q <num_queries>
```
Number of queries per hop.
```
-w
```
Wait timeout milliseconds for each reply.
```
-4
```

Force using IPv4.

    `-6`

Force using IPv6.

    `-?`

Displays help at the command prompt.

Example:

```
C:\Users\DELL>pathping 202.12.103.20

Tracing route to 202.12.103.20 over a maximum of 30 hops

```

Name: finger

Usage:

Finger command is a user information lookup command which gives details of all the users logged in.

Syntax:
    `finger [options]`

options:

    `-l`

Displays information in long list format.

    `user`

Specifies the user you want information about. Omit the user parameter to display information about all users on the specified host.

    `@host`

Specifies the server on the remote system whose users you want information about.

```
                -?
                        Displays help at the command prompt.
```

Example:

```
C:\Users\DELL>finger 202.12.103.20

[jaswanthpc]
```

Name: hostname
Usage:

Displays the host name portion of the full computer name of the computer

Syntax:

```
    Hostname [options]
```

```
Options:
                -?
                        Displays help at the command prompt.
```

Example:

```
C:\Users\DELL>hostname
jaswanthpc
```

Name: whoami
Usage:

Displays user, group and privileges information for the user who is currently logged on to the local system. If used without parameters, `whoami` displays the current domain and username.

Syntax:

whoami [options]

options:

```
            /upn
                    Displays the user name in user principal name (UPN) format.
            /fqdn
                    Displays the user name in fully qualified domain name (FQDN) format.
            /logonid
                    Displays the logon ID of the current user.
            /user
                    Displays the current domain and user name of the security identifier (SID).
            /groups
                    Displays the user groups to which the current user belongs.
            /priv
                    Displays the security privileges of the current user.
```

```
/fo <Format>
        Specifies the output format.
/all

        Displays all information in the current access token, including the current
        user name, security identifiers (SID), privileges, and groups that the current
        user belongs to.
/nh

        Specifies that the column header should not be displayed in the output. This
        is valid only for table and CSV formats.
/?

        Displays help at the command prompt.
```

Example:

```
C:\Users\DELL>whoami
jaswanthpc\dell
```

Lab-2

Aim: To explore configure various network topologies.

Theory:

Bus topology

Bus topology, also known as line topology, is a type of network topology in which all devices in the network are connected by one central RJ-45 network cable or coaxial cable.

Star topology

Star topology is a network topology in which each network component is physically connected to a central node such as a router, hub, or switch. In a star topology, the central hub acts like a server and the connecting nodes act like clients.

Mesh topology

In a mesh topology there is no central connection point. Instead, each node is connected to at least one other node and usually to more than one. Each node is capable of sending messages to and receiving messages from other nodes.

Ring topology

Ring topology is a type of network topology in which each device is connected to two other devices on either side via an RJ-45 cable or coaxial cable. This forms a circular ring of connected devices which gives it its name

Output:

Star topology:
```
Cisco Packet Tracer PC Command Line 1.0
C:\>ping 192.168.1.4

Pinging 192.168.1.4 with 32 bytes of data:

Reply from 192.168.1.4: bytes=32 time=4ms TTL=128
Reply from 192.168.1.4: bytes=32 time<1ms TTL=128
Reply from 192.168.1.4: bytes=32 time=2ms TTL=128
Reply from 192.168.1.4: bytes=32 time<1ms TTL=128

Ping statistics for 192.168.1.4:
    Packets: Sent = 4, Received = 4, Lost = 0 (0% loss),
Approximate round trip times in milli-seconds:
    Minimum = 0ms, Maximum = 4ms, Average = 1ms
```

Bus topology:

```
Cisco Packet Tracer PC Command Line 1.0
C:\>ping 192.168.1.6

Pinging 192.168.1.6 with 32 bytes of data:

Reply from 192.168.1.6: bytes=32 time=4ms TTL=128
Reply from 192.168.1.6: bytes=32 time<1ms TTL=128
Reply from 192.168.1.6: bytes=32 time<1ms TTL=128
Reply from 192.168.1.6: bytes=32 time=2ms TTL=128

Ping statistics for 192.168.1.6:
    Packets: Sent = 4, Received = 4, Lost = 0 (0% loss),
Approximate round trip times in milli-seconds:
    Minimum = 0ms, Maximum = 4ms, Average = 1ms
```

Mesh topology:

```
Cisco Packet Tracer PC Command Line 1.0
C:\>ping 192.168.1.9

Pinging 192.168.1.9 with 32 bytes of data:

Reply from 192.168.1.9: bytes=32 time=4ms TTL=128
Reply from 192.168.1.9: bytes=32 time<1ms TTL=128
Reply from 192.168.1.9: bytes=32 time=2ms TTL=128
Reply from 192.168.1.9: bytes=32 time=3ms TTL=128

Ping statistics for 192.168.1.9:
    Packets: Sent = 4, Received = 4, Lost = 0 (0% loss),
Approximate round trip times in milli-seconds:
    Minimum = 0ms, Maximum = 4ms, Average = 2ms
```

Ring topology:

```
Cisco Packet Tracer PC Command Line 1.0
C:\>ping 192.168.1.15

Pinging 192.168.1.15 with 32 bytes of data:

Reply from 192.168.1.15: bytes=32 time=301ms TTL=128
Reply from 192.168.1.15: bytes=32 time<1ms TTL=128
Reply from 192.168.1.15: bytes=32 time=4ms TTL=128
Reply from 192.168.1.15: bytes=32 time=4ms TTL=128

Ping statistics for 192.168.1.15:
    Packets: Sent = 4, Received = 4, Lost = 0 (0% loss),
Approximate round trip times in milli-seconds:
    Minimum = 0ms, Maximum = 301ms, Average = 77ms
```

Lab-3

Aim: To configure switch for different topologies.

Theory: The commands used to configure the switches and assign to them a unique set of ip addresses are:
1.enable: To enter privileged EXEC mode
2.hostname enter-host-here: To set hostname
3.enable secret priv-pass: The password is set in encrypted form
4.ip address enter-ip-here enter-subnet-here: To set ip address and subnet
5.no shutdown: This command enables an interface
6.end: This command is issued to return to privileged mode.

To check for network connectivity:
- Ping ip-address-of-end-device-on-network

Outputs:

- Star topology

Lab-4

**Aim:** To explore and configure VLANs.

Theory:

A network switch connects devices within a network and forwards data packets to and from those devices. Unlike a router, a switch only sends data to the single device it is intended for (which may be another switch, a router, or a user's computer), not to networks of multiple devices.

Output:

Network Diagram:

Switch configuration:

```
Switch#conf t
Enter configuration commands, one per line.  End with CNTL/Z.

Lab-5

Aim: To configure Router

Software Used: - Packet Tracer by Cisco

THEORY

A **router** is a device that connects two or more packet-switched networks or subnetworks. It serves two primary functions: managing traffic between these networks by forwarding data packets to their intended IP addresses and allowing multiple devices to use the same Internet connection.

A network **switch** forwards data packets between groups of devices in the same network, whereas a router forwards data between different networks.

Output:
Router configuration:

```
Router>enable
Router#conf t
Enter configuration commands, one per line.  End with CNTL/Z.
Router(config)#hostname R1
R1(config)#interface g0/0/0

Lab-6
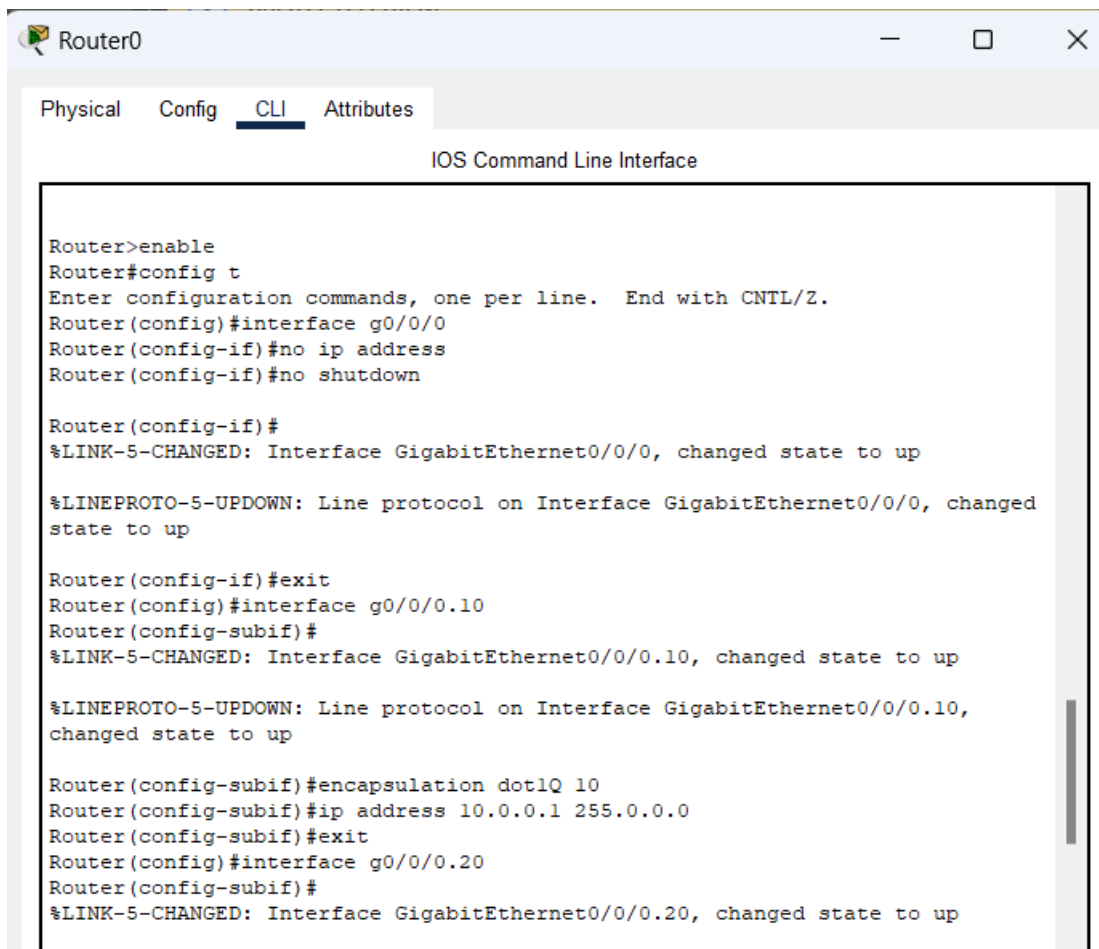

Aim: configuring router and learn about 802.11 protocol

Theory:

The 802.11 protocol consists of a series of half-duplex over-the-air modulation techniques that use the same basic protocol. The 802.11 protocol family employs carrier-sense multiple access with collision avoidance whereby equipment listens to a channel for other users before transmitting each frame.

Output:

Lab-7

Aim: To configure ipv6 address on a router

Theory: IPv4 users can move to IPv6 and receive services such as exit-to-exit security, quality of service (QoS), and globally unique addresses.
In the ipv6 address interface configuration command, you must enter the ipv6-address and ipv6-prefix variables with the address specified in hexadecimal using 16-bit values between colons.

Output:

Router2

Physical   Config   CLI   Attributes

testing

```
C:\>ping 192.168.12.2

Pinging 192.168.12.2 with 32 bytes of data:

Reply from 192.168.12.2: bytes=32 time=9ms TTL=128
Reply from 192.168.12.2: bytes=32 time=9ms TTL=128
Reply from 192.168.12.2: bytes=32 time=8ms TTL=128
Reply from 192.168.12.2: bytes=32 time=8ms TTL=128

Ping statistics for 192.168.12.2:
    Packets: Sent = 4, Received = 4, Lost = 0 (0% loss),
Approximate round trip times in milli-seconds:
    Minimum = 8ms, Maximum = 9ms, Average = 8ms
```

Lab-9

Aim:

To use DHCP, DNS & WEB services using servers.

Theory:

1.**DHCP server:** It is used to assign IP address to the client machines automatically.

2. **DNS server:** It is used to resolve the domain name to IP address. It is also used to resolve the IP address to domain name.

3.**WEB server:** It is used to host the web pages. It is also used to host the web applications.

Code:

```
R1#disable
R1>enable
R1#conf t
Enter configuration commands, one per line.  End with CNTL/Z.
R1(config)#int gig0/0/0
R1(config-if)#ip address 192.168.1.1 255.255.255.0
R1(config-if)#exit
R1(config)#
```

OUTPUTS:
1.ON the router port

GigabitEthernet0/0/0

Port Status — On
Bandwidth — 1000 Mbps / 100 Mbps / 10 Mbps — Auto
Duplex — Half Duplex / Full Duplex — Auto
MAC Address — 00D0.BC0D.7D01

IP Configuration
IPv4 Address — 192.168.1.1
Subnet Mask — 255.255.255.0

Tx Ring Limit — 10

2. Apply configuration settings to router to assign it IP address

```
R1#disable
R1>enable
R1#conf t
Enter configuration commands, one per line.  End with CNTL/Z.
R1(config)#int gig0/0/0
R1(config-if)#ip address 192.168.1.1 255.255.255.0
R1(config-if)#exit
R1(config)#
```

3. Change server 0 services to apply it DHCP

4. Change server 1 services to ON DNS

5.Change server 1 services to ON DHCP

6.Change server 2 services to ON DHCP

7.Change HTML page to server 2
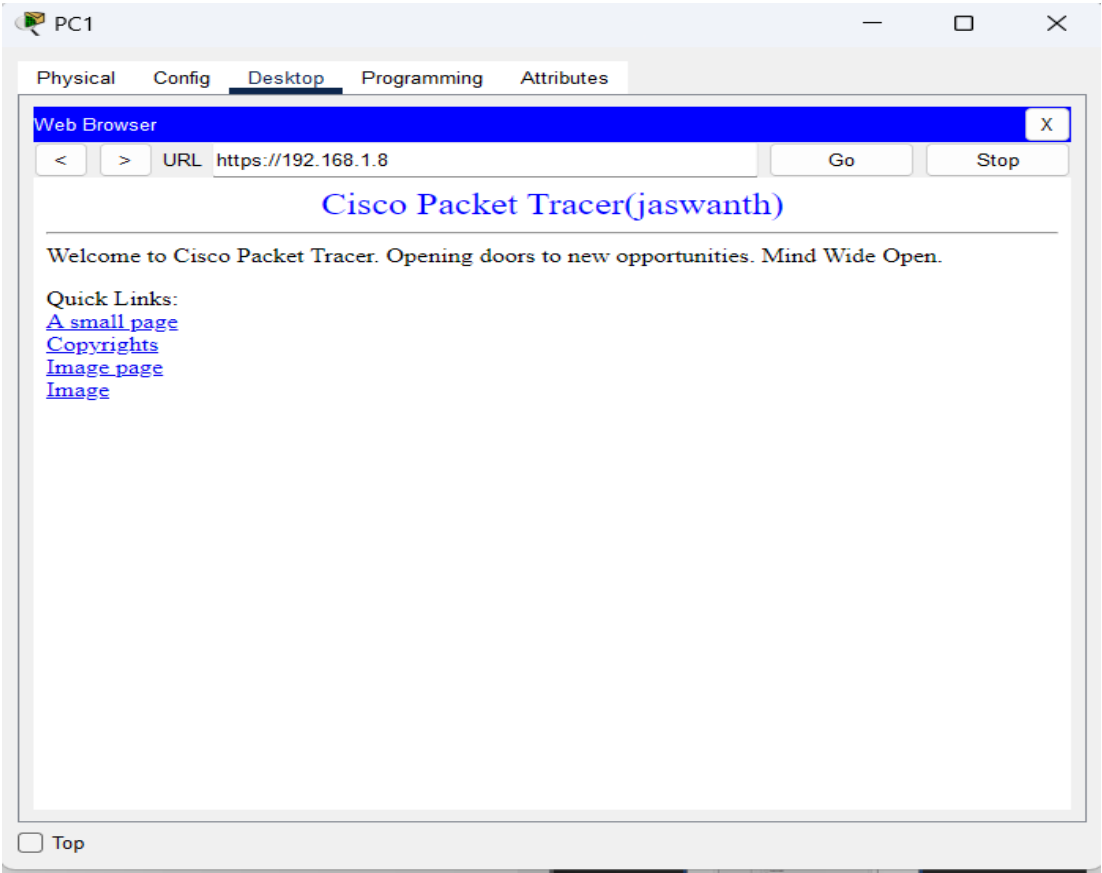

10.Checking the connection across different PC's

Fire	Last Status	Source	Destination	Type	Color	Time(sec)	Periodic	Num	Edit	Delete	
	Successful	PC1	PC0	ICMP		0.000	N	0	(edit)		(delete)
	Successful	PC0	PC1	ICMP		0.000	N	1	(edit)		(delete)
